Convolutional Neural Networks

Why convolutions?

Why convolutions

main advantages $\begin{cases} \text{parameter sharing} \\ \text{sparsity of connection} \end{cases}$

$$5 \times 5 = 25$$

$$26$$

$$6 \times 26 = 156 \text{ parameters}$$

$$3,072 \times 4,704 \approx 14M \text{ weight}$$

a lot of parameters to train
when image is large

Why convolutions

이 잘 동작하는가?

*

1	0	-1
1	0	-1
1	0	-1

3x3

=

0	30	30	0
0	30	30	0
0	30	30	0
0	30	30	0
0	30	30	0

translation invariance 라는 좋은 특성을 가짐

Parameter sharing: A feature detector (such as a vertical edge detector) that's useful in one part of the image is probably useful in another part of the image.

→ **Sparsity of connections:** In each layer, each output value depends only on a small number of inputs.

이 두 메커니즘 덕분에 네트워크는 아주 적은 파라미터를 갖게 되고, 이는 NN이 smaller training sets로 학습될 수 있게 해주며 오버피팅이 일어날 염려를 덜어준다.

Andrew Ng

Putting it together

Training set $(x^{(1)}, y^{(1)}) \dots (x^{(m)}, y^{(m)})$.

$$\text{Cost } J = \frac{1}{m} \sum_{i=1}^m \mathcal{L}(\hat{y}^{(i)}, y^{(i)})$$

Use gradient descent to optimize parameters to reduce J
