Basics of Neural Network Programming

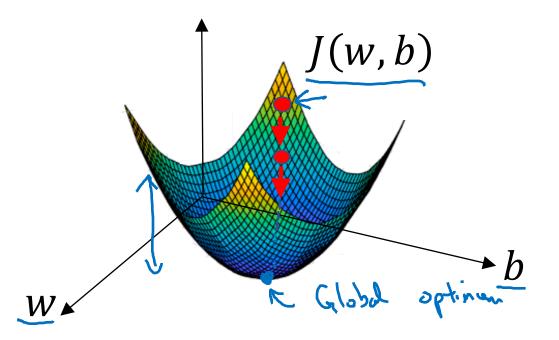

Gradient Descent

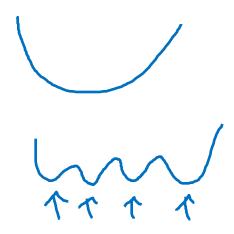

Gradient Descent

Recap:
$$\hat{y} = \sigma(w^T x + b)$$
, $\sigma(z) = \frac{1}{1 + e^{-z}} \leftarrow$

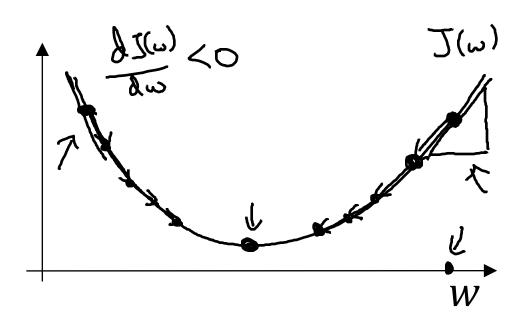

$$\underline{J(w,b)} = \frac{1}{m} \sum_{i=1}^{m} \mathcal{L}(\hat{y}^{(i)}, y^{(i)}) = -\frac{1}{m} \sum_{i=1}^{m} y^{(i)} \log \hat{y}^{(i)} + (1 - y^{(i)}) \log(1 - \hat{y}^{(i)})$$

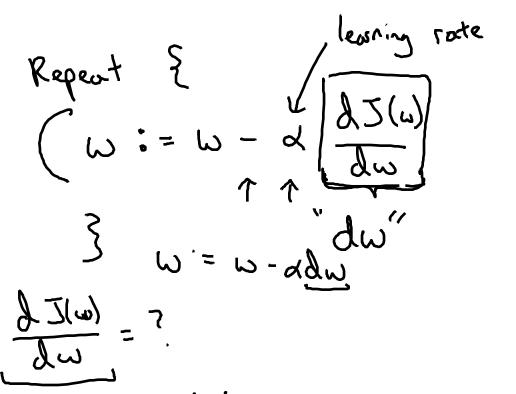

Want to find w, b that minimize J(w, b)

Gradient Descent

$$J(\omega,b)$$

$$\omega := \omega - d \underbrace{\partial J(\omega,b)}_{\partial \omega} \underbrace{\partial Z(\omega,b)}_{\partial \omega} \underbrace{\partial Z(\omega,b)}_{\partial \omega} \underbrace{\partial Z(\omega,b)}_{\partial \omega} \underbrace{\partial Z(\omega,b)}_{\partial \omega}$$

$$b := b - d \underbrace{\partial Z(\omega,b)}_{\partial \omega} \underbrace{\partial Z(\omega,b)}_{\partial \omega} \underbrace{\partial Z(\omega,b)}_{\partial \omega}$$
